

ABSTRACT OF THE DISCLOSURE

A handle tube and a vacuum cleaner equipped with the handle. The vacuum cleaner includes a brush capable of inhaling air that contains external dust, and a cleaner body for supplying suction force to the brush. The vacuum cleaner further includes a handle tube interposed between the brush and the cleaner body to interconnect the brush and the cleaner body to allow air to flow through the handle tube, wherein a predetermined part of the handle tube is formed as a handle to be gripped by a user. A cyclone cleaner is provided that is structured in such a manner that the flow passage of the handle tube is formed to take a handle shape and thus a separate handle is not
10 needed.
